Concentrations and anomalies are in μg/m³. SD = sample standard deviation (ddof=1). Missing measurements are excluded without interpolation. Active-fire statistics use all active-fire hours, not only downwind hours. Mean anomaly = period mean minus the saved station-, event-, and pollutant-specific seven-day prefire baseline. Values are displayed to two decimal places. Selection categories do not confirm smoke exposure. Existing analysis windows and chronological event identifiers are retained; all timestamps use KST. Baseline REVIEW pairs are marked and retained. Reporting subset: two nearest eligible stations, then up to three additional stations by downwind hours. Proximity threshold: 25 km; candidate radius: 50 km.
